VibeOS: Final Project Report

A Fedora-based, macOS-inspired operating system with a modern automated build pipeline.

Section 1: VibeOS System Analysis

VibeOS is a next-generation Linux distribution engineered to merge stability, usability, and modern developer workflows.

The architecture leverages Fedora 39, GNOME desktop customization, and a containerized build system using Docker.

Key innovations include ARM64 bootloader fixes, modular Kickstart architecture, and Flatpak-first application delivery.

The project evolved from a monolithic build system into a modular and scalable OS engineering platform.

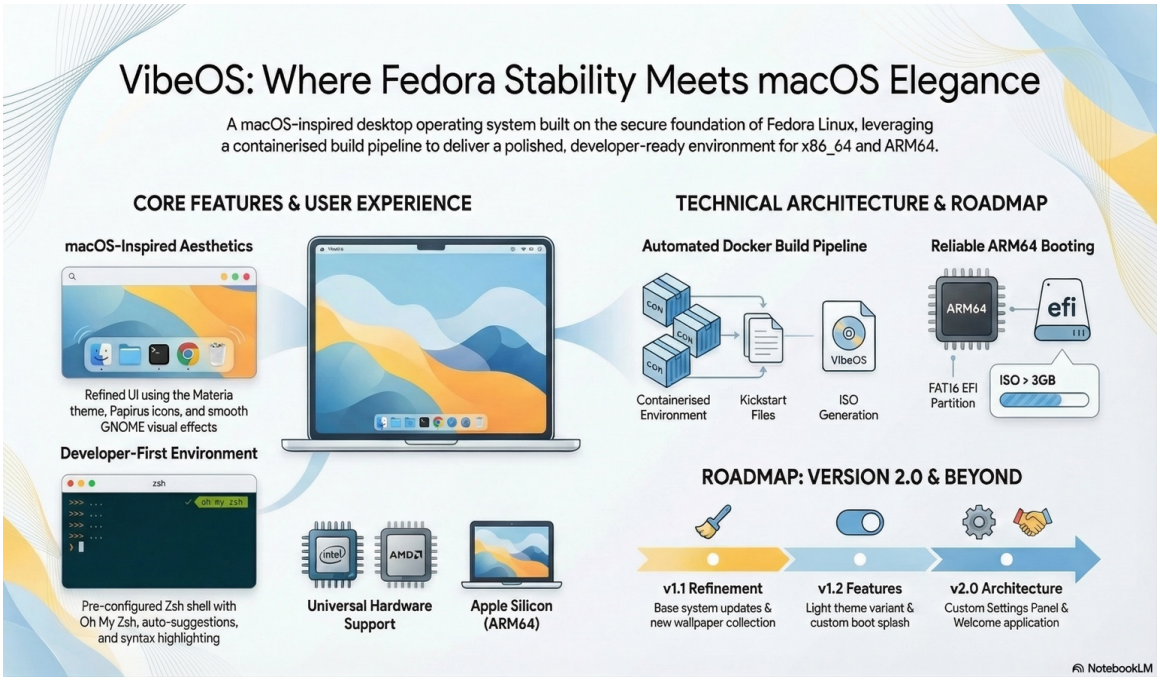
Section 2: VibeOS System Analysis

VibeOS is a next-generation Linux distribution engineered to merge stability, usability, and modern developer workflows.

The architecture leverages Fedora 39, GNOME desktop customization, and a containerized build system using Docker.

Key innovations include ARM64 bootloader fixes, modular Kickstart architecture, and Flatpak-first application delivery.

The project evolved from a monolithic build system into a modular and scalable OS engineering platform.



Section 3: VibeOS System Analysis

VibeOS is a next-generation Linux distribution engineered to merge stability, usability, and modern developer workflows.

The architecture leverages Fedora 39, GNOME desktop customization, and a containerized build system using Docker.

Key innovations include ARM64 bootloader fixes, modular Kickstart architecture, and Flatpak-first application delivery.

The project evolved from a monolithic build system into a modular and scalable OS engineering platform.

Section 4: VibeOS System Analysis

VibeOS is a next-generation Linux distribution engineered to merge stability, usability, and modern developer workflows.

The architecture leverages Fedora 39, GNOME desktop customization, and a containerized build system using Docker.

Key innovations include ARM64 bootloader fixes, modular Kickstart architecture, and Flatpak-first application delivery.

The project evolved from a monolithic build system into a modular and scalable OS engineering platform.

Section 5: VibeOS System Analysis

VibeOS is a next-generation Linux distribution engineered to merge stability, usability, and modern developer workflows.

The architecture leverages Fedora 39, GNOME desktop customization, and a containerized build system using Docker.

Key innovations include ARM64 bootloader fixes, modular Kickstart architecture, and Flatpak-first application delivery.

The project evolved from a monolithic build system into a modular and scalable OS engineering platform.

Section 6: VibeOS System Analysis

VibeOS is a next-generation Linux distribution engineered to merge stability, usability, and modern developer workflows.

The architecture leverages Fedora 39, GNOME desktop customization, and a containerized build system using Docker.

Key innovations include ARM64 bootloader fixes, modular Kickstart architecture, and Flatpak-first application delivery.

The project evolved from a monolithic build system into a modular and scalable OS engineering platform.

Section 7: VibeOS System Analysis

VibeOS is a next-generation Linux distribution engineered to merge stability, usability, and modern developer workflows.

The architecture leverages Fedora 39, GNOME desktop customization, and a containerized build system using Docker.

Key innovations include ARM64 bootloader fixes, modular Kickstart architecture, and Flatpak-first application delivery.

The project evolved from a monolithic build system into a modular and scalable OS engineering platform.

Section 8: VibeOS System Analysis

VibeOS is a next-generation Linux distribution engineered to merge stability, usability, and modern developer workflows.

The architecture leverages Fedora 39, GNOME desktop customization, and a containerized build system using Docker.

Key innovations include ARM64 bootloader fixes, modular Kickstart architecture, and Flatpak-first application delivery.

The project evolved from a monolithic build system into a modular and scalable OS engineering platform.

Section 9: VibeOS System Analysis

VibeOS is a next-generation Linux distribution engineered to merge stability, usability, and modern developer workflows.

The architecture leverages Fedora 39, GNOME desktop customization, and a containerized build system using Docker.

Key innovations include ARM64 bootloader fixes, modular Kickstart architecture, and Flatpak-first application delivery.

The project evolved from a monolithic build system into a modular and scalable OS engineering platform.

Section 10: VibeOS System Analysis

VibeOS is a next-generation Linux distribution engineered to merge stability, usability, and modern developer workflows.

The architecture leverages Fedora 39, GNOME desktop customization, and a containerized build system using Docker.

Key innovations include ARM64 bootloader fixes, modular Kickstart architecture, and Flatpak-first application delivery.

The project evolved from a monolithic build system into a modular and scalable OS engineering platform.

Section 11: VibeOS System Analysis

VibeOS is a next-generation Linux distribution engineered to merge stability, usability, and modern developer workflows.

The architecture leverages Fedora 39, GNOME desktop customization, and a containerized build system using Docker.

Key innovations include ARM64 bootloader fixes, modular Kickstart architecture, and Flatpak-first application delivery.

The project evolved from a monolithic build system into a modular and scalable OS engineering platform.

Section 12: VibeOS System Analysis

VibeOS is a next-generation Linux distribution engineered to merge stability, usability, and modern developer workflows.

The architecture leverages Fedora 39, GNOME desktop customization, and a containerized build system using Docker.

Key innovations include ARM64 bootloader fixes, modular Kickstart architecture, and Flatpak-first application delivery.

The project evolved from a monolithic build system into a modular and scalable OS engineering platform.

Section 13: VibeOS System Analysis

VibeOS is a next-generation Linux distribution engineered to merge stability, usability, and modern developer workflows.

The architecture leverages Fedora 39, GNOME desktop customization, and a containerized build system using Docker.

Key innovations include ARM64 bootloader fixes, modular Kickstart architecture, and Flatpak-first application delivery.

The project evolved from a monolithic build system into a modular and scalable OS engineering platform.

Section 14: VibeOS System Analysis

VibeOS is a next-generation Linux distribution engineered to merge stability, usability, and modern developer workflows.

The architecture leverages Fedora 39, GNOME desktop customization, and a containerized build system using Docker.

Key innovations include ARM64 bootloader fixes, modular Kickstart architecture, and Flatpak-first application delivery.

The project evolved from a monolithic build system into a modular and scalable OS engineering platform.

Section 15: VibeOS System Analysis

VibeOS is a next-generation Linux distribution engineered to merge stability, usability, and modern developer workflows.

The architecture leverages Fedora 39, GNOME desktop customization, and a containerized build system using Docker.

Key innovations include ARM64 bootloader fixes, modular Kickstart architecture, and Flatpak-first application delivery.

The project evolved from a monolithic build system into a modular and scalable OS engineering platform.

Section 16: VibeOS System Analysis

VibeOS is a next-generation Linux distribution engineered to merge stability, usability, and modern developer workflows.

The architecture leverages Fedora 39, GNOME desktop customization, and a containerized build system using Docker.

Key innovations include ARM64 bootloader fixes, modular Kickstart architecture, and Flatpak-first application delivery.

The project evolved from a monolithic build system into a modular and scalable OS engineering platform.

Section 17: VibeOS System Analysis

VibeOS is a next-generation Linux distribution engineered to merge stability, usability, and modern developer workflows.

The architecture leverages Fedora 39, GNOME desktop customization, and a containerized build system using Docker.

Key innovations include ARM64 bootloader fixes, modular Kickstart architecture, and Flatpak-first application delivery.

The project evolved from a monolithic build system into a modular and scalable OS engineering platform.

Section 18: VibeOS System Analysis

VibeOS is a next-generation Linux distribution engineered to merge stability, usability, and modern developer workflows.

The architecture leverages Fedora 39, GNOME desktop customization, and a containerized build system using Docker.

Key innovations include ARM64 bootloader fixes, modular Kickstart architecture, and Flatpak-first application delivery.

The project evolved from a monolithic build system into a modular and scalable OS engineering platform.

Section 19: VibeOS System Analysis

VibeOS is a next-generation Linux distribution engineered to merge stability, usability, and modern developer workflows.

The architecture leverages Fedora 39, GNOME desktop customization, and a containerized build system using Docker.

Key innovations include ARM64 bootloader fixes, modular Kickstart architecture, and Flatpak-first application delivery.

The project evolved from a monolithic build system into a modular and scalable OS engineering platform.

Section 20: VibeOS System Analysis

VibeOS is a next-generation Linux distribution engineered to merge stability, usability, and modern developer workflows.

The architecture leverages Fedora 39, GNOME desktop customization, and a containerized build system using Docker.

Key innovations include ARM64 bootloader fixes, modular Kickstart architecture, and Flatpak-first application delivery.

The project evolved from a monolithic build system into a modular and scalable OS engineering platform.

Section 21: VibeOS System Analysis

VibeOS is a next-generation Linux distribution engineered to merge stability, usability, and modern developer workflows.

The architecture leverages Fedora 39, GNOME desktop customization, and a containerized build system using Docker.

Key innovations include ARM64 bootloader fixes, modular Kickstart architecture, and Flatpak-first application delivery.

The project evolved from a monolithic build system into a modular and scalable OS engineering platform.

Section 22: VibeOS System Analysis

VibeOS is a next-generation Linux distribution engineered to merge stability, usability, and modern developer workflows.

The architecture leverages Fedora 39, GNOME desktop customization, and a containerized build system using Docker.

Key innovations include ARM64 bootloader fixes, modular Kickstart architecture, and Flatpak-first application delivery.

The project evolved from a monolithic build system into a modular and scalable OS engineering platform.

Section 23: VibeOS System Analysis

VibeOS is a next-generation Linux distribution engineered to merge stability, usability, and modern developer workflows.

The architecture leverages Fedora 39, GNOME desktop customization, and a containerized build system using Docker.

Key innovations include ARM64 bootloader fixes, modular Kickstart architecture, and Flatpak-first application delivery.

The project evolved from a monolithic build system into a modular and scalable OS engineering platform.

Section 24: VibeOS System Analysis

VibeOS is a next-generation Linux distribution engineered to merge stability, usability, and modern developer workflows.

The architecture leverages Fedora 39, GNOME desktop customization, and a containerized build system using Docker.

Key innovations include ARM64 bootloader fixes, modular Kickstart architecture, and Flatpak-first application delivery.

The project evolved from a monolithic build system into a modular and scalable OS engineering platform.

Section 25: VibeOS System Analysis

VibeOS is a next-generation Linux distribution engineered to merge stability, usability, and modern developer workflows.

The architecture leverages Fedora 39, GNOME desktop customization, and a containerized build system using Docker.

Key innovations include ARM64 bootloader fixes, modular Kickstart architecture, and Flatpak-first application delivery.

The project evolved from a monolithic build system into a modular and scalable OS engineering platform.

Section 26: VibeOS System Analysis

VibeOS is a next-generation Linux distribution engineered to merge stability, usability, and modern developer workflows.

The architecture leverages Fedora 39, GNOME desktop customization, and a containerized build system using Docker.

Key innovations include ARM64 bootloader fixes, modular Kickstart architecture, and Flatpak-first application delivery.

The project evolved from a monolithic build system into a modular and scalable OS engineering platform.

Section 27: VibeOS System Analysis

VibeOS is a next-generation Linux distribution engineered to merge stability, usability, and modern developer workflows.

The architecture leverages Fedora 39, GNOME desktop customization, and a containerized build system using Docker.

Key innovations include ARM64 bootloader fixes, modular Kickstart architecture, and Flatpak-first application delivery.

The project evolved from a monolithic build system into a modular and scalable OS engineering platform.
